Static Block:

- Is used to initialize the static data member.
- We can not invoke a static block, rather JVM invokes the static block at the time of class loading.
- It is executed before main method at the time of class loading.
- We can define more than one static block in the java program.

```java
public class Demo
{
    static
        {
                System.out.println("hi Static block is Invoked");
                System.exit(0);
        }
    public static void main(String[] args)
        {
                System.out.println("hi from main method");
        }
}
```
